ABOUT

Software/DevOps Engineer at Rokt, building AI-native operational tools and leading technical development across high-scale data infrastructure and customer-facing products. Currently the primary engineering lead deployed with Pay+, delivering product integrations and platform capabilities. Experienced in Kubernetes, AWS, distributed systems, high-volume data pipelines, and automation. Adaptable engineer who works across domains, takes ownership of complex technical builds, and translates business needs into scalable software solutions.

EXPERIENCE

Rokt *New York, NY*

Software Engineer II - Deployed Engineer, Pay+ Aug 2026 – Present

- Launched embedded charitable donations for Pay+, Rokt's payment-page monetization platform, developing an iframe based integration that keeps shoppers on partner sites without impacting cart conversion.
- Eliminated engineering dependencies from partner launches by migrating custom integrations into Rokt's campaign management platform, enabling campaign owners to configure and launch independently.
- Served as the engineering point of contact for enterprise partners, including Macy's, financial institutions, and charities; scoped third-party API integrations and developed technical implementation guides for account managers.

Software Engineer II - Launch Engineering *Apr. 2026 – Present*

- Lead the technical development of Orbit, an AI-native operations platform integrating HubSpot, data lake, Datadog, and campaign data into a unified ticket context. Owned the architecture, platform development, CI/CD, agent guardrails, and code review of the project.
- Co-developed an AI-powered operations triage agent that executes deterministic checks across internal databases and tools, then uses tailored language models to generate preliminary diagnoses.
- Built ingestion infrastructure for a session event explorer that traces the lifecycle of an advertisement from SDK initialization to click, processing approximately 6 billion events daily through Kafka consumers across 256 partitions and up to 64 autoscaling EKS pods.
- Designed a 40 TB PostgreSQL hot storage architecture using UUIDv7, daily partitioning, Zstandard compression, and partition based retention, with historical data served through Apache Iceberg and Trino.

Kepler Communications *Toronto, ON*

System Administrator (2025 – 2026); IT Specialist (2022 – 2025) June 2022 – Mar. 2026

- Supported software, IT, and infrastructure operations for Kepler, an optical data relay satellite network operator.
- Migrated 50+ services from legacy infrastructure to Kubernetes and improved GitLab CI/CD workflows across a multi-team codebase.
- Developed Python/Django and React features for an internal hardware testing platform integrated with NetBox.
- Maintained Prometheus/Grafana monitoring and participated in on-call support for IT and satellite operations; managed IAM, SSO, and access reviews for partner compliance.
- Implemented backup and disaster recovery processes with nightly snapshots and automated integrity checks, achieving zero data loss incidents; launched an Intune MDM program supporting 160+ devices.

EDUCATION

Wilfrid Laurier University *Waterloo, ON*

Bachelor of Science, Computer Science Sept. 2017 – Dec. 2021

Coursework: Data Structures, Algorithms, Databases, Computer Systems, Machine Learning, Cryptography, Astronomy

SKILLS

Programming & Tools: Python, TypeScript, React, Node.js, Next.js, Django, FastAPI, REST APIs, Bash, SQL

AI Engineering: AI agents, multi agent orchestration, Large Language Models (LLMs), Model Context Protocol (MCP), tool calling, evals, guardrails, model routing, prompt engineering, harness utilization

Data: Kafka streaming, PostgreSQL, Apache Iceberg, Trino, Zstandard, data pipelines, distributed systems

DevOps/Cloud/Infra: Kubernetes (Amazon EKS), Terraform, Helm, Istio, GitHub Actions, Buildkite, GitLab CI/CD, AWS, Azure, Datadog, Prometheus, Grafana

Interests: Formula 1, Golf, Astronomy, Startups
